

Tumblr live-test fixture: verified digital signature

What this is: a PDF signed with a throwaway self-signed certificate (CN=Tumblr Test Signer), SHA-256, detached CMS.

Expected in Tumblr: the status bar shows the badge

"Verified Signed Document"

(intact signature - it does NOT mean the signer is trusted).

Any edit + save must invalidate the signature.

Regenerate (needs openssl on PATH):

```
cargo run --example gen_signature_fixtures
```

Sentinel: SIGNED-DEMO
